

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Original) A dual-domain microcontroller to communicate secure system management information, comprising: a satellite management controller to receive a request for system management information and to provide system management information of a computer board set through a bus interface; and a baseboard management controller to receive the system management information from the computer board set and to transmit the system management information to the computer board set through a computer board set bus interface, wherein the satellite management controller and the baseboard management controller operate simultaneously on the computer board set.
2. (Original) The dual-domain microcontroller of claim 1, wherein the satellite management controller and the baseboard management controller are both implemented in an application-specific integrated circuit (ASIC) located on the computer board set.
3. (Original) The dual-domain microcontroller of claim 1, wherein the satellite management module and the baseboard management module are both implemented in a flash memory on the computer board set.
